

Lesson 5: Layouts

About this lesson

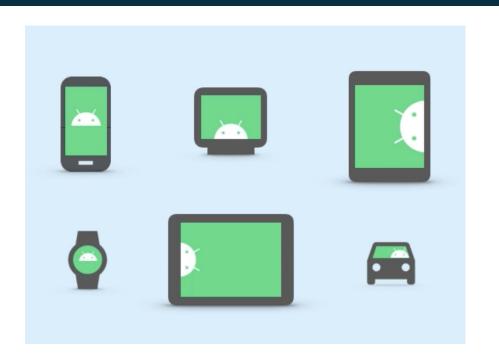

Lesson 5: Layouts

- Layouts in Android
- ConstraintLayout
- Additional topics for ConstraintLayout
- Data binding
- Displaying lists with RecyclerView
- Summary

Layouts in Android

Android devices

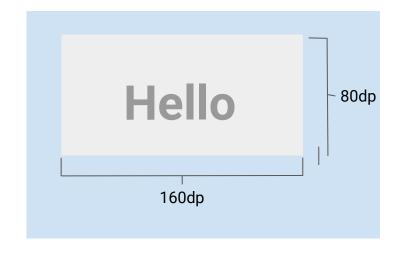

- Android devices come in many different form factors.
- More and more pixels per inch are being packed into device screens.
- Developers need the ability to specify layout dimensions that are consistent across devices.

Density-independent pixels (dp)

Use dp when specifying sizes in your layout, such as the width or height of views.

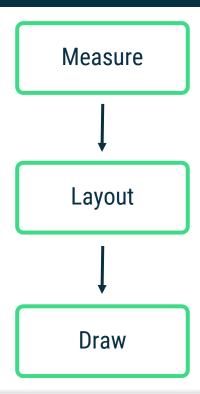

- Density-independent pixels (dp) take screen density into account.
- Android views are measured in density-independent pixels.
- dp = (width in pixels * 160)screen density

Screen-density buckets

Density qualifier	Description	DPI estimate
Idpi (mostly unused)	Low density	~120dpi
mdpi (baseline density)	Medium density	~160dpi
hdpi	High density	~240dpi
xhdpi	Extra-high density	~320dpi
xxhdpi	Extra-extra-high density	~480dpi
xxxhdpi	Extra-extra-high density	~640dpi

Android View rendering cycle

Drawing region

What we see:

How it's drawn:

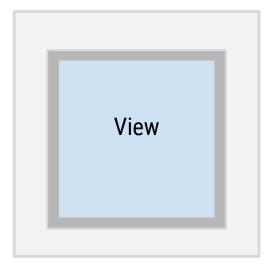

View margins and padding

View with margin

View with margin and padding

ConstraintLayout

Deeply nested layouts are costly

- Deeply nested ViewGroups require more computation
- Views may be measured multiple times
- Can cause UI slowdown and lack of responsiveness

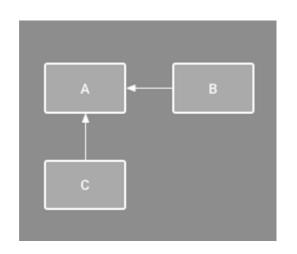

Use ConstraintLayout to avoid some of these issues!

What is ConstraintLayout?

- Recommended default layout for Android
- Solves costly issue of too many nested layouts, while allowing complex behavior
- Position and size views within it using a set of constraints

What is a constraint?

A restriction or limitation on the properties of a View that the layout attempts to respect

Relative positioning constraints

Can set up a constraint relative to the parent container

Format:

layout_constraint<SourceConstraint>_to<TargetConstraint>Of

Example attributes on a TextView:

app:layout_constraintTop_toTopOf="parent"

app:layout_constraintLeft_toLeftOf="parent"

Relative positioning constraints

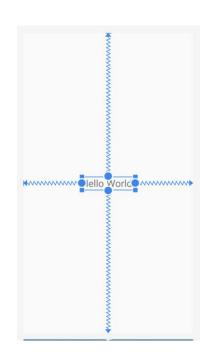

Relative positioning constraints

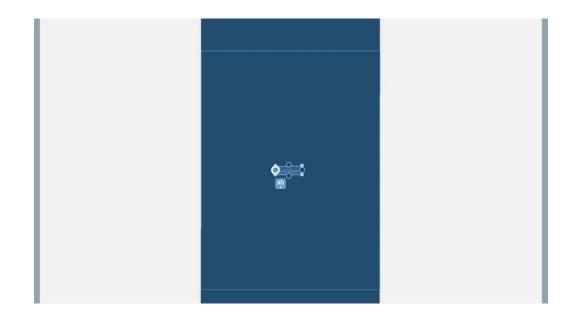

Simple ConstraintLayout example

```
<androidx.constraintlayout.widget.ConstraintLayout</pre>
    android:layout width="match parent"
    android:layout height="match parent">
    <TextView
app:layout constraintBottom toBottomOf="parent"
        app:layout constraintEnd toEndOf="parent"
        app:layout constraintStart toStartOf="parent"
        app:layout constraintTop toTopOf="parent" />
```

Layout Editor in Android Studio

You can click and drag to add constraints to a View.

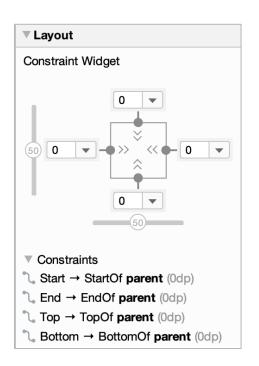

Constraint Widget in Layout Editor

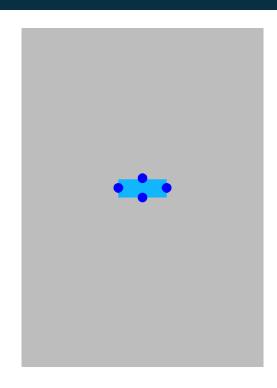

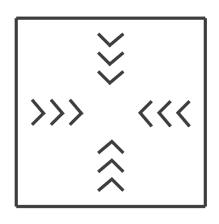

>>> Wrap content

Match constraints

Wrap content for width and height

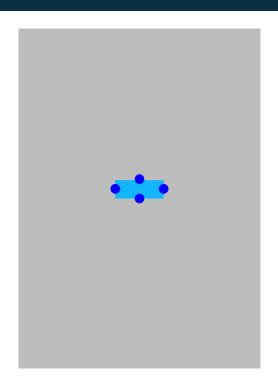

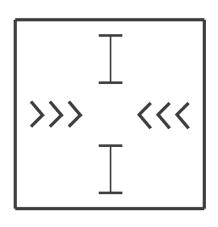

layout_width wrap_content

layout_height wrap_content

Wrap content for width, fixed height

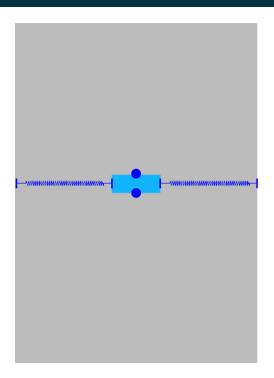

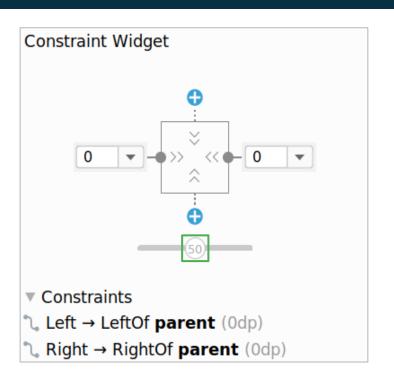

layout_width wrap_content

layout_height 48dp

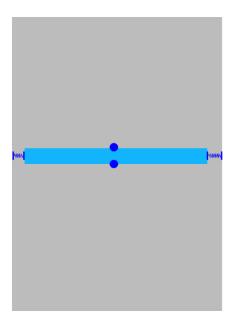

Center a view horizontally

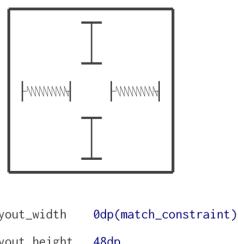

Use match_constraint

Can't use match parent on a child view, use match constraint instead

layout_width

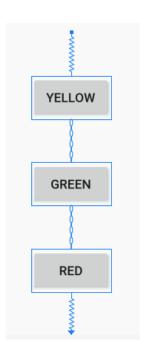

layout_height

Chains

- Let you position views in relation to each other
- Can be linked horizontally or vertically
- Provide much of LinearLayout functionality

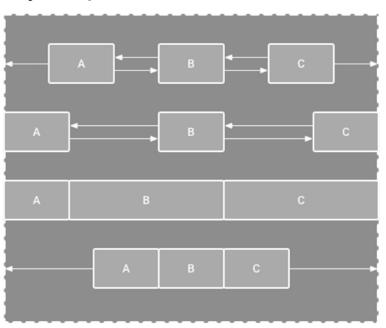

Create a Chain in Layout Editor

- 1. Select the objects you want to be in the chain.
- Right-click and select **Chains**.
- 3. Create a horizontal or vertical chain.

Chain styles

Adjust space between views with these different chain styles.

Spread Chain

Spread Inside Chain

Weighted Chain

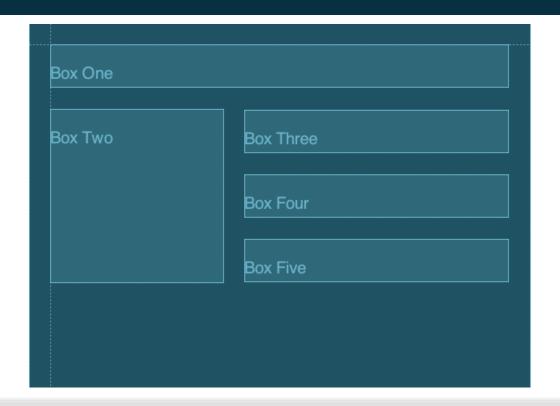

Packed Chain

Additional topics for ConstraintLayout

Guidelines

- Let you position multiple views relative to a single guide
- Can be vertical or horizontal
- Allow for greater collaboration with design/UX teams
- Aren't drawn on the device

Guidelines in Android Studio

Example Guideline

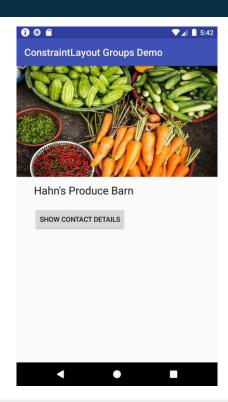

```
<ConstraintLayout>
   <androidx.constraintlayout.widget.Guideline</pre>
       android:id="@+id/start guideline"
       android:layout width="wrap content"
       android:layout height="wrap content"
       android:orientation="vertical"
       app:layout constraintGuide begin="16dp" />
   <TextView ...
       app:layout constraintStart toEndOf="@id/start guideline" />
</ConstraintLayout>
```

Creating Guidelines

- layout_constraintGuide_begin
- layout_constraintGuide_end
- layout_constraintGuide_percent

Groups

- Control the visibility of a set of widgets
- Group visibility can be toggled in code

Example group

```
<androidx.constraintlayout.widget.Group
    android:id="@+id/group"
    android:layout_width="wrap_content"
    android:layout_height="wrap_content"
    app:constraint_referenced_ids="locationLabel,locationDetails"/>
```

Groups app code

```
override fun onClick(v: View?) {
    if (group.visibility == View.GONE) {
        group.visibility = View.VISIBLE
        button.setText(R.string.hide details)
    } else {
        group.visibility = View.GONE
        button.setText(R.string.show details)
```

Data binding

Current approach: findViewById()

Traverses the View hierarchy each time

```
MainActivity.kt
                                                  activity main.xml
                                                  <ConstraintLayout ... >
                                  findViewById
val name = findViewById(...)
                                                    <TextView
val age = findViewById(...)
                                                       android:id="@+id/name"/>
                                  findViewById
val loc = findViewById(...)
                                                    <TextView
                                                        android:id="@+id/age"/>
name.text = ...
                                  findViewById
                                                    <TextView
age.text = ...
                                                       android:id="@+id/loc"/>
loc.text = ...
                                                  </ConstraintLayout>
```

Use data binding instead

Bind UI components in your layouts to data sources in your app.

Android Development with Kotlin

MainActivity.kt

Val binding: Activity Main Binding

binding.name.text = ... binding.age.text = ... binding.loc.text = ...

```
initialize binding
```

```
activity main.xml
<layout>
   <ConstraintLayout ... >
       <TextView
          android:id="@+id/name"/>
       <TextView
          android:id="@+id/age"/>
        <TextView
          android:id="@+id/loc"/>
   </ConstraintLayout>
</layout>
```

Modify build.gradle file

```
android {
    ...
    buildFeatures {
        dataBinding true
    }
}
```

Add layout tag

Layout inflation with data binding

```
Replace this
setContentView(R.layout.activity main)
```

with this

```
val binding: ActivityMainBinding = DataBindingUtil.setContentView(
    this, R.layout.activity_main)
```

binding.username = "Melissa"

Data binding layout variables

```
<layout>
   <data>
       <variable name="name" type="String"/>
   </data>
   <androidx.constraintlayout.widget.ConstraintLayout>
       <TextView
           android:id="@+id/textView"
           android:text="@{name}" />
   </androidx.constraintlayout.widget.ConstraintLayout>
</layout>
In MainActivity.kt:
binding.name = "John"
```

Data binding layout expressions

```
<layout>
   <data>
       <variable name="name" type="String"/>
   </data>
   <androidx.constraintlayout.widget.ConstraintLayout>
       <TextView
           android:id="@+id/textView"
           android:text="@{name.toUpperCase()}" />
   </androidx.constraintlayout.widget.ConstraintLayout>
</layout>
```

Displaying lists with RecyclerView

RecyclerView

- Widget for displaying lists of data
- "Recycles" (reuses) item views to make scrolling more performant
- Can specify a list item layout for each item in the dataset
- Supports animations and transitions

RecyclerView.Adapter

- Supplies data and layouts that the RecyclerView displays
- A custom Adapter extends from RecyclerView.Adapter and overrides these three functions:
 - getItemCount
 - onCreateViewHolder
 - onBindViewHolder

View recycling in RecyclerView

Chicago, Illinois

Mountain View, California

Miami, Florida

Seattle, Washington

Reno, Nevada

Nashville, Tennessee

Boston, Massachusetts

Little Rock, Arkansas

If item is scrolled offscreen, it isn't destroyed. Item is put in a pool to be recycled.

onBindViewHolder binds the view with the new values, and then the view gets reinserted in the list.

Add RecyclerView to your layout

```
<androidx.recyclerview.widget.RecyclerView
android:id="@+id/rv"
android:scrollbars="vertical"
android:layout_width="match_parent"
android:layout_height="match_parent"/>
```

Create a list item layout

```
res/layout/item view.xml
<FrameLayout</pre>
   android:layout width="match parent"
   android:layout height="wrap content">
   <TextView
       android:id="@+id/number"
       android:layout width="match parent"
       android:layout height="wrap content" />
</FrameLayout>
```

Create a list adapter

```
class MyAdapter(val data: List<Int>) : RecyclerView.Adapter<MyAdapter.MyViewHolder>()
   class MyViewHolder(val row: View) : RecyclerView.ViewHolder(row) {
       val textView = row.findViewById<TextView>(R.id.number)
  override fun onCreateViewHolder(parent: ViewGroup, viewType: Int): MyViewHolder {
       val layout = LayoutInflater.from(parent.context).inflate(R.layout.item view,
                    parent, false)
       return MyViewHolder(layout)
   override fun onBindViewHolder(holder: MyViewHolder, position: Int) {
       holder.textView.text = data.get(position).toString()
   override fun getItemCount(): Int = data.size
```

Set the adapter on the RecyclerView

```
In MainActivity.kt:
override fun onCreate(savedInstanceState: Bundle?) {
    super.onCreate(savedInstanceState)
    setContentView(R.layout.activity_main)
    val rv: RecyclerView = findViewById(R.id.rv)
    rv.layoutManager = LinearLayoutManager(this)
    rv.adapter = MyAdapter(IntRange(0, 100).toList())
```

Summary

Summary

In Lesson 5, you learned how to:

- Specify lengths in dp for your layout
- Work with screen densities for different Android devices
- Render Views to the screen of your app
- Layout views within a ConstraintLayout using constraints
- Simplify getting View references from layout with data binding
- Display a list of text items using a RecyclerView and custom adapter

Learn more

- Pixel density on Android
- Spacing
- Device metrics
- Type scale
- Build a Responsive UI with ConstraintLayout
- Data Binding Library
- Create dynamic lists with RecyclerView

Pathway

Practice what you've learned by completing the pathway:

<u>Lesson 5: Layouts</u>
